## **DFESW7 Project Risk Assessment**

Date	Description	Evaluation		
<b>31/1/2022</b>	Wifi goes down	I would be able to work locally but unable to push any work to repository		
31/1/2022	Computer Issues, Unresponsive Apps	I'd be unable to open applications and continue to do any work		
01/02/2022	Power Cut	I would lose the ability to do any work		
01/02/2022	Github servers go down	I would be unable to access my repository		
02/02/2022	Possibility of Sickness	Depending on the level of sickness, it would range from slower pace of work to unable to work		

Likelihood	Impact Level	Responsibility	Response
Unlikely to occur, but not impossible	low, work can still be done locally	The wifi provider	If this occurs, I will continue to work locally until it is resolved
low-medium	medium	I am	If, for example, MySQL Workbench was unresponsive, I would still be able to use the H2 login.
low	high	Local Energy Provider	Would be unable to respond until the matter was resolved externally
low	medium	GitHub server	I'd still be able to work off of any locally saved files
low	low-high dependant on level of sickness	Mine, to look after myself	Depending on sickness, either bed rest or just cold and flu medication

Control Measures
N/A, down to Wifi Service provider
I have H2 and Swagger docs setup so if Workbench or Postman becomes unresponsive, I have alternatives
Unsure as its down to the local energy provider, but potentially use laptops so that the battery life will last
Make sure I have locally saved backups of all files
look after myself
